

The proofgraph package

Pierre Senellart
pierre@senellart.com

2026/05/31 v0.1.0

Abstract

The `proofgraph` package automatically produces a graph of the dependencies between the results (theorems, lemmas, propositions) of a mathematical article. It infers an edge from one result to another whenever the proof of the former refers to the latter through an ordinary cross-reference, requiring no manual annotation. The graph is written as a `Graphviz .dot` file, which can be rendered externally or, optionally, embedded into the document automatically.

1 Introduction

When writing a mathematical article, it is often useful to visualise how the results depend on one another: which lemma is used in the proof of which theorem, and so on. `proofgraph` builds such a dependency graph automatically. Each theorem-like environment becomes a node; each cross-reference (`\ref`, `\cref`, ...) appearing *inside a proof* becomes an edge from the proved result to the referred-to result.

2 Usage

Load the package after any theorem-providing package (such as `amsthm`) and *before* your `\newtheorem` declarations:

```
\usepackage{proofgraph}
\newtheorem{theorem}{Theorem}
\newtheorem{lemma}{Lemma}
```

Then write your document as usual. After two compilation runs, a file `\jobname.dot` is produced. Render it with `Graphviz`:

```
dot -Tpdf myfile.dot -o mygraph.pdf
```

`\uses` Inside a proof, `\uses{⟨label⟩}` records a dependency on the result labelled `⟨label⟩` even when no visible reference is made. A comma-separated list is accepted: `\uses{lem:a,lem:b}`.

`\proofgraphedge` `\proofgraphedge{⟨A⟩}{⟨B⟩}` adds an edge recording that result `⟨A⟩` depends on result `⟨B⟩`, like a `\uses` but stated outside any proof. This is handy for an “obvious” corollary that relies on earlier results without a `proof` environment:

`\proofgraphedge{cor:x}{thm:y}`. It may appear anywhere; both labels are resolved when the graph is written.

`\proofof` By default a proof is attached to the most recently started result, and deferred proofs (as with `apxproof`) are attached automatically to the result they prove. When a proof does not directly follow its result, `\proofof{<label>}` inside the proof pins it to the result labelled `<label>`.

`\proofgraphtrack` Result environments are detected automatically. Expository environments are excluded from the graph by default (`definition`, `example`, `remark`, `note`). In the preamble, `\proofgraphhuntrack{<names>}` excludes further environment types and `\proofgraphtrack{<names>}` forces environments to be tracked (overriding the default exclusions), e.g. `\proofgraphhuntrack{observation}` or `\proofgraphtrack{definition}`. Nodes are labelled by the result’s formatted name and number (“Theorem 1”), not by the environment name.

`\proofgraphignore` `\proofgraphignore{<from>}{<to>}` suppresses the edge from `<from>` to `<to>` (e.g. an unwanted forward citation).

`\proofgraphexclude` `\proofgraphexclude{<label>}` removes the result labelled `<label>`, together with all its incident edges, from the graph.

`\proofgraphstyle` `\proofgraphstyle{<env>}{<attrs>}` sets Graphviz node attributes for all results of the environment `<env>`, e.g. `\proofgraphstyle{lemma}{shape=ellipse,color=blue}`.

`\proofgraphstylecite` `\proofgraphstylecite{<attrs>}` sets the Graphviz attributes of the external citation nodes added by the `cite` option (default `shape=note`), e.g. `\proofgraphstylecite{shape=box,style=note}`.

`\proofgraph` In `autorun` mode, `\proofgraph` includes the rendered graph at that point (using the image produced on the previous run).

2.1 Options

option `selfloops=remove` (default) drops edges from a result to itself; `selfloops=keep` retains them.

option `autorun` (boolean, default false) runs Graphviz automatically at the end of the `autorun` run; requires compilation with shell-escape enabled.

option Graphviz layout engine (default `dot`).

engine Output format for `autorun`/`\proofgraph` (default `pdf`).

option `direction=usedby` (default) orients an edge from the result that is used to the result that uses it, so an arrow `a->b` reads “a is used by b” (b relies on a).

format `direction=uses` reverses it (`a->b` means “a uses b”).

option Graph direction (default `LR`).

rankdir `cite` (boolean, default false) also captures `\cite` inside proofs as dependencies on external work, drawn as distinct nodes. A `\cite` optional note is kept:

option `\cite[Thm~3]{key}` labels the node “Thm 3, ...”.

option `citelabel=key` (default) labels citation nodes by their `BIBTEX` key; `citelabel=tag` uses the printed citation tag instead (“[1]”, “[Knu74]”, “[Abiteboul et al. 1995]”, ...), recovered from the `.aux` (so it needs two runs). It supports the standard, `hyperref`-wrapped and `natbib` (numeric and author–year) bibliographies; if no clean tag can be recovered (e.g. before the first `BIBTEX` run) it keeps the key.

option Base name of the output file (default `\jobname`).

file

2.2 Use with apxproof

`apxproof` moves proofs to the appendix and typesets them there, so the references a proof makes are only executed at that later point. To attribute them to the right

result, `proofgraph` relies on the hook `\apxproofhook`, which `apxproof` fires inside each deferred proof. This hook is available in `apxproof v1.4.1` and later; load the two packages in either order and no further setup is needed.

With an *earlier* `apxproof` the document still compiles cleanly and every result still becomes a node, but *no proof dependencies are captured* (the graph has nodes but no proof edges), because `proofgraph` cannot tell which appendix proof belongs to which result. In that case, add the dependencies manually with `\uses` (and `\proofof` to pin a proof to its result), or upgrade `apxproof`.

3 Limitations

Nodes are created only for environments declared through `\newtheorem` *after* the package is loaded. Results must be labelled for references to them to be resolved. Two compilation runs are required, as for any cross-reference. Theorem titles containing the characters " or \ in the node label are not escaped in this version.

4 Implementation

```

1 \*package
2 \NeedsTeXFormat{LaTeX2e}[2005/12/01]
3 \ProvidesPackage{proofgraph}
4   [2026/05/31 v0.1.0 Dependency graph of results]

```

4.1 Dependencies

```

5 \RequirePackage{amsthm}
6 \RequirePackage{etoolbox}
7 \RequirePackage{xstring}
8 \RequirePackage{kvoptions}
9 \RequirePackage{graphicx}

```

`\pgph@trimsp` An expandable space-trimmer (labels inside a `\cite/\cref/\uses` list arrive with the space after each comma), built on the `expl3` primitive so it is robust to leading spaces and braces.

```

10 \ExplSyntaxOn
11 \cs_new:Npn \pgph@trimsp #1 { \tl_trim_spaces:n {#1} }
12 \ExplSyntaxOff

```

4.2 Options

```

13 \SetupKeyvalOptions{family=pgph,prefix=pgph@}
14 \DeclareStringOption[remove]{selfloops}
15 \DeclareBoolOption{autorun}
16 \DeclareStringOption[dot]{engine}
17 \DeclareStringOption[pdf]{format}
18 \DeclareStringOption[LR]{rankdir}
19 \DeclareStringOption[usedby]{direction}
20 \DeclareBoolOption{cite}
21 \DeclareStringOption[key]{citelabel}
22 \DeclareStringOption{file}
23 \ProcessKeyvalOptions*
24 \ifx\pgph@file\empty\def\pgph@file{\jobname}\fi

```

4.3 Literal braces

We need catcode-12 braces to write the Graphviz digraph `{ }` block.

```

25 \begingroup
26   \catcode'\ [=1 \catcode'\ ]=2
27   \catcode'\ {=12 \catcode'\ }=12
28   \gdef\pgph@ob[{}]%
29   \gdef\pgph@cb[{}]%
30 \endgroup

```

4.4 Data structures

A global counter gives each result instance a unique numeric id. Nodes and edges are accumulated in list macros and emitted at end of document, so that editing commands (ignore, exclude, self-loops) can be applied to the complete graph regardless of where they appear.

```

31 \newcount\pgph@idcnt
32 \def\pgph@nodes{}
33 \def\pgph@edges{}
34 \def\pgph@ignores{}
35 \def\pgph@excludes{}
36 \let\pgph@curresult\@empty
37 \let\pgph@curproof\@empty

```

`\pgph@auxmap` The label-to-id map. `\label` inside a result records, both in memory and in the `.aux` file, that the user label maps to the current node id, so references resolve independently of hyperref.

```

38 \newcommand\pgph@auxmap[2]{\global\@namedef{pgph@map@#1}{#2}}
39 \newcommand\pgph@setmap[2]{%
40   \edef\pgph@tmpid{#2}%
41   \global\expandafter\edef\csname pgph@map@#1\endcsname{\pgph@tmpid}%
42   \protected@write\@auxout{}\string\pgph@auxmap{#1}{\pgph@tmpid}}%
43 }

```

4.5 Registering result environments

`\pgph@register` A result environment is tracked by installing a begin-hook that records a node. In every declaration command (`\newtheorem`, `\spnewtheorem`) the environment *name* is the first mandatory argument, so registration does not need to parse the remaining (varied) arguments. Each name met is queued as a *candidate* (deduplicated); the begin-hooks themselves are installed only at `\begin{document}`, once the inclusion and exclusion lists are settled, so the customisation commands below may appear anywhere in the preamble.

```

44 \let\pgph@candidates\@empty
45 \newcommand\pgph@register[1]{%
46   \edef\pgph@thisname{#1}%
47   \IfBeginWith\pgph@thisname{axp@}{-}{%
48     \ifcsname pgph@cand@\pgph@thisname\endcsname\else
49       \global\@namedef{pgph@cand@\pgph@thisname}{-}%
50       \ifx\pgph@candidates\@empty
51         \global\let\pgph@candidates\pgph@thisname
52       \else

```

```

53      \xdef\pgph@candidates{\pgph@candidates,\pgph@thisname}%
54      \fi
55    \fi
56  }%
57 }

```

We wrap `\newtheorem` (and, for Springer classes, `\spnewtheorem`) to register each newly declared environment, replaying the original command so its own argument parsing is untouched. The starred (unnumbered) forms are *not* auto-registered: a results graph wants numbered statements, and these forms are commonly used for unnumbered repeats of a result (e.g. the appendix copies produced by `apxproof` and `myproofs`), which would otherwise appear as spurious unnumbered duplicate nodes. Use `\proofgraphtrack` to track an unnumbered environment deliberately.

```

58 \let\pgph@orig@newtheorem\newtheorem
59 \renewcommand\newtheorem{\@ifstar{\pgph@nt@star}{\pgph@nt@plain}}
60 \newcommand\pgph@nt@plain[1]{\pgph@register{#1}\pgph@orig@newtheorem{#1}}
61 \newcommand\pgph@nt@star[1]{\pgph@orig@newtheorem*{#1}}
62 \ifdefined\spnewtheorem
63   \let\pgph@orig@spnewtheorem\spnewtheorem
64   \renewcommand\spnewtheorem{\@ifstar{\pgph@spnt@star}{\pgph@spnt@plain}}
65   \newcommand\pgph@spnt@plain[1]{\pgph@register{#1}\pgph@orig@spnewtheorem{#1}}
66   \newcommand\pgph@spnt@star[1]{\pgph@orig@spnewtheorem*{#1}}
67 \fi

```

```

\proofgraphtrack
\proofgraphuntrack
\proofgraphtrack
\proofgraphuntrack

```

Result environments are detected automatically, but the analysis can be tuned. `\proofgraphtrack{<names>}` forces the listed environments to be tracked, overriding any exclusion; `\proofgraphuntrack{<names>}` excludes the listed environment *types*. Expository environments are excluded by default: `definition`, `example`, `remark`, `note`. Both commands belong in the preamble. `\pgph@defaultenvs` is the list of class-predefined names probed at `\begin{document}`; `\pgph@defaultexclude` seeds the exclusion set.

```

68 \newcommand\pgph@defaultenvs{theorem,lemma,proposition,corollary,definition,%
69   conjecture,claim,fact,remark,example,observation,notation,problem,%
70   question,property,assumption,hypothesis,principle}
71 \newcommand\pgph@defaultexclude{definition,example,remark,note}
72 \newcommand\proofgraphtrack[1]{%
73   \@for\pgph@one:=#1\do{%
74     \csundef{pgph@xtype@\pgph@one}%
75     \global\@namedef{pgph@force@\pgph@one}{}%
76     \expandafter\pgph@register\expandafter{\pgph@one}%
77   }%
78 }
79 \newcommand\proofgraphuntrack[1]{%
80   \@for\pgph@one:=#1\do{%
81     \csundef{pgph@force@\pgph@one}%
82     \global\@namedef{pgph@xtype@\pgph@one}{}%
83   }%
84 }
85 \expandafter\proofgraphuntrack\expandafter{\pgph@defaultexclude}

```

Environments predefined by the document class (`acmart`, `lipics`, `Springer`)

classes) are declared before the package is loaded, so the wrappers above never see them. At `\begin{document}` we add every common result name that exists to the candidate list, then install a begin-hook for each candidate that is forced or not excluded.

```

86 \newcommand\pgph@dohook[1]{%
87   \ifcsname pgph@hooked@#1\endcsname\else
88     \global\@namedef{pgph@hooked@#1}{}%
89     \AtBeginEnvironment{#1}{\pgph@beginresult{#1}}%
90   \fi
91 }
92 \newcommand\pgph@maybehook[1]{%
93   \ifcsname pgph@force@#1\endcsname
94     \pgph@dohook{#1}%
95   \else
96     \ifcsname pgph@xtype@#1\endcsname\else\pgph@dohook{#1}\fi
97   \fi
98 }
99 \newcommand\pgph@resolveregistration[1]{%
100   \@for\pgph@one:=#1\do{%
101     \ifcsname\pgph@one\endcsname\expandafter\pgph@register\expandafter{\pgph@one}\fi}%
102   \ifx\pgph@candidates\@empty\else
103     \@for\pgph@one:=\pgph@candidates\do{%
104       \expandafter\pgph@maybehook\expandafter{\pgph@one}}%
105   \fi
106 }
107 \AtBeginDocument{%
108   \expandafter\pgph@resolveregistration\expandafter{\pgph@defaultenvs}%

```

`\pgph@beginresult` Start a result: allocate an id and record the node. The node is keyed and styled by `\pgph@hooknames` the environment name (third argument, also a fallback label), but displayed by the result's *formatted* name ("Theorem", "Lemma"), captured from the heading. We get that name by locally wrapping `\@begintheorem/\@opargbegintheorem` (the hooks every `amsthm`- and `\newtheorem`-based class routes its heading through), whose first argument is the title. These redefinitions are confined to the current environment group, so they revert at `\end`. We also locally redefine `\label` to populate the map.

Nodes are accumulated in *reverse* order of appearance (`\pgph@prependnode`). With `rankdir=LR`, `Graphviz` stacks disconnected components vertically in the order they are read, from the bottom up; emitting the results last-to-first therefore lays them out top-to-bottom in document order (first result on top), while connected results stay grouped. This is a layout tendency, not a guarantee, but needs no `pack` trickery.

```

109 \newcommand\pgph@prependnode[1]{%
110   \xdef\pgph@nodes{\unexpanded{#1}\unexpanded\expandafter{\pgph@nodes}}%
111 }
112 \newcommand\pgph@beginresult[1]{%
113   \global\advance\pgph@idcnt\@ne
114   \xdef\pgph@curresult{\the\pgph@idcnt}%
115   \protected@edef\pgph@tmp{%
116     \noexpand\pgph@node{\pgph@curresult}{#1}{#1}}%
117   \expandafter\pgph@prependnode\expandafter{\pgph@tmp}%
118   \pgph@hooknames

```

```

119 \ifx\label\pgph@maplabel\else\let\pgph@savdlablel\label\fi
120 \let\label\pgph@maplabel
121 }
122 \newcommand\pgph@hooknames{%
123   \ifdefined\@begintheorem
124     \let\pgph@orig@bt\@begintheorem
125     \def\@begintheorem##1##2{\pgph@recordresult{##1}{##2}\pgph@orig@bt{##1}{##2}}%
126   \fi
127   \ifdefined\@opargbegintheorem
128     \let\pgph@orig@obt\@opargbegintheorem
129     \def\@opargbegintheorem##1##2##3{%
130       \pgph@recordresult{##1}{##2}\pgph@orig@obt{##1}{##2}{##3}}%
131   \fi
132   \ifdefined\@spbegintheorem
133     \let\pgph@orig@spbt\@spbegintheorem
134     \def\@spbegintheorem##1##2##3##4{%
135       \pgph@recordresult{##1}{##2}\pgph@orig@spbt{##1}{##2}{##3}{##4}}%
136   \fi
137   \ifdefined\@spopargbegintheorem
138     \let\pgph@orig@spobt\@spopargbegintheorem
139     \def\@spopargbegintheorem##1##2##3##4##5{%
140       \pgph@recordresult{##1}{##2}\pgph@orig@spobt{##1}{##2}{##3}{##4}{##5}}%
141   \fi
142 }

```

The formatted name is the first argument of every heading macro (`\@begintheorem`/`\@opargbegintheorem` for `amsthm`/`\newtheorem`, `\@spbegintheorem`/`\@spopargbegintheorem` for Springer's `\spnewtheorem`); the second argument is the number. We use that second argument only to tell *whether* the result is numbered (it is empty for the starred, unnumbered forms): an unnumbered result records no number, so it is dropped at emission unless tracked explicitly. The number *value*, when present, is read from `\@currentlabel` rather than from that argument, which some classes pollute (e.g. `lipics` injects `\advance\par@deathcycles\@ne`). `\@currentlabel`, set by the result's `\refstepcounter` just before the heading, is the clean number and needs no `\label`. Values are reduced to plain strings now, with fragile wrappers neutralized (notably `apxproof`'s forward-link). The first heading wins (guarded on the name), ignoring nested headings. The emptiness of the number argument is tested without expanding it, so a polluted (but non-empty) number does not trip the test.

```

143 \newcommand\pgph@recordresult[2]{%
144   \ifcsname pgph@name@\pgph@curresult\endcsname\else
145     \begingroup
146       \let\protect\@empty
147       \def\axp@forward@link##1##2{##2}%
148       \edef\pgph@tmpname{#1}%
149       \global\expandafter\let\csname pgph@name@\pgph@curresult\endcsname
150         \pgph@tmpname
151       \global\@namedef{pgph@seen@\pgph@curresult}{}%
152       \def\pgph@tmpn{#2}%
153       \ifx\pgph@tmpn\@empty\else
154         \edef\pgph@tmpnum{\@currentlabel}%
155         \global\expandafter\let\csname pgph@num@\pgph@curresult\endcsname
156           \pgph@tmpnum

```

```

157     \fi
158   \endgroup
159 \fi
160 }

```

`\pgph@maplabel` records the label-to-node mapping. As a fallback for classes whose headings pass through none of the hooked heading macros (so no heading was `seen`), it also captures the number from `\@currentlabel`. We do *not* do this once a heading was seen: there, an absent number means the result is genuinely unnumbered (a starred form), and `\@currentlabel` could be a stale value from an earlier result. The value is expanded to a plain string *now*, inside a group where fragile wrappers are neutralized, so that nothing dangerous survives to the emission pass: in particular, under `apxproof` forward-linking, `\@currentlabel` holds `\xpf@forward@link{<target>}{<number>}`, whose hyper-link machinery must never be expanded in a non-typesetting context (it would run away). Reducing it to its number argument keeps it harmless.

```

\pgph@maplabel
161 \newcommand\pgph@maplabel[1]{%
162   \pgph@setmap{#1}{\pgph@curresult}%
163   \ifcsname pgph@num@\pgph@curresult\endcsname\else
164     \ifcsname pgph@seen@\pgph@curresult\endcsname\else
165       \begingroup
166         \let\protect\@empty
167         \def\xpf@forward@link##1##2{##2}%
168         \edef\pgph@tmpnum{\@currentlabel}%
169         \global\expandafter\let\csname pgph@num@\pgph@curresult\endcsname\pgph@tmpnum
170       \endgroup
171     \fi
172   \fi
173   \pgph@savlabel{#1}%
174 }

```

4.6 Hooking proofs

Inside a proof we redefine the reference commands to capture edges from the proved result.

```

175 \newcommand\pgph@addedge[2]{%
176   \protected@edef\pgph@tmpedge{\noexpand\pgph@edge{#1}{#2}}%
177   \expandafter\g@addto@macro\expandafter\pgph@edges\expandafter{\pgph@tmpedge}%
178 }
179 \newcommand\pgph@recordref[1]{%
180   \ifx\pgph@curproof\@empty\else
181     \@for\pgph@one:=#1\do{%
182       \edef\pgph@k{\expandafter\pgph@trimsp\expandafter{\pgph@one}}%
183       \pgph@addedge{\pgph@curproof}{\pgph@k}%
184     }
185   \fi

```

`\pgph@beginproof` Attach the proof to the current result and install the capturing versions of the reference commands (only those that exist).

The capturing commands are `\protected` so that, when a reference appears in a moving argument inside a proof (e.g. a `\caption`), they do not expand into the `.aux/.lof` and leak internal tokens.

```

186 \protected\def\pgph@cap@ref#1{\pgph@recordref{#1}\pgph@saved@ref{#1}}
187 \protected\def\pgph@cap@cref#1{\pgph@recordref{#1}\pgph@saved@cref{#1}}
188 \protected\def\pgph@cap@Cref#1{\pgph@recordref{#1}\pgph@saved@Cref{#1}}
189 \protected\def\pgph@cap@autoref#1{\pgph@recordref{#1}\pgph@saved@autoref{#1}}
190 \protected\def\pgph@cap@eqref#1{\pgph@recordref{#1}\pgph@saved@eqref{#1}}
191 \protected\def\pgph@cap@vref#1{\pgph@recordref{#1}\pgph@saved@vref{#1}}
192 \newcommand\pgph@install[1]{%
193   \ifcsname #1\endcsname
194     \expandafter\ifx\csname #1\expandafter\endcsname\csname pgph@cap@#1\endcsname
195     \else
196       \expandafter\let\csname pgph@saved@#1\expandafter\endcsname\csname #1\endcsname
197       \expandafter\let\csname #1\expandafter\endcsname\csname pgph@cap@#1\endcsname
198     \fi
199   \fi
200 }
201 \newcommand\pgph@beginproof{%
202   \let\pgph@curproof\pgph@curresult
203   \pgph@install{ref}\pgph@install{cref}\pgph@install{Cref}%
204   \pgph@install{autoref}\pgph@install{eqref}\pgph@install{vref}%
205   \ifpgph@cite\pgph@installcite\fi
206 }

```

Packages such as `apxproof` capture the body of a proof verbatim (to defer it to the appendix) and replay it there. Patching the `proof` environment then corrupts that capture (its `\proof` has delimited arguments), and the references are only executed at replay time anyway. So the standard `begin-proof` hook is installed only when no such package is active; otherwise the deferred-proof capture (below) takes over. The registration happens at `\begin{document}`, once we know what is loaded.

```

207 \newif\ifpgph@apxproof
208 \AtBeginDocument{%
209   \@ifpackageloaded{apxproof}%
210     {\pgph@apxprooftrue\pgph@apxinit}%
211     {\AtBeginEnvironment{proof}{\pgph@beginproof}}%
212 }

```

`\pgph@apxinit` Under `apxproof`, deferred proofs are typeset in the appendix, where their references finally execute. `apxproof` fires `\apxproofhook` inside each such proof, passing the `axp@r<n>` label of the proved theorem, which (because `apxproof` also attaches that label to the theorem in the main text) is already in our map. We resolve it to the source node and install the reference-capturing commands for the duration of the proof.

```

213 \newcommand\pgph@apxinit{\def\apxproofhook##1{\pgph@apxproofcapture{##1}}}
214 \newcommand\pgph@apxproofcapture[1]{%
215   \edef\pgph@curproof{\pgph@resolve{#1}}%
216   \ifx\pgph@curproof\@empty\else
217     \pgph@install{ref}\pgph@install{cref}\pgph@install{Cref}%
218     \pgph@install{autoref}\pgph@install{eqref}\pgph@install{vref}%
219     \ifpgph@cite\pgph@installcite\fi
220   \fi

```

221 }

`\pgph@hookcite` Optional `\cite` capture: external references become `cite:-`prefixed target labels, drawn later as distinct nodes. A `\cite` optional note, `\cite[⟨note⟩]{⟨key⟩}`, is recorded for the key(s) and shown in the node label as “⟨note⟩, ⟨key⟩”. The note is reduced to a plain string at capture time (fragile wrappers neutralized); the first note seen for a key wins.

```

222 \newcommand\pgph@cap@cite[2][]{%
223   \ifx\pgph@curproof\@empty\else
224     \def\pgph@citenotearg{#1}%

285 }

```

4.9 Emission

`\pgph@node` Emit one node line, honouring exclusions and per-environment styling. External (`cite:`) targets are emitted separately as a pass over edges. An *unnumbered* result (no number captured) is omitted: a results graph is about numbered statements, and unnumbered theorem-like environments are typically expository or repeated copies (e.g. a class-predefined `\spnewtheorem*{claim}`). `\proofgraphtrack{<env>}` overrides this, so a deliberately unnumbered environment is still drawn.

```

286 \newcommand\pgph@node[3]{%
287   \ifcsname pgph@ex@#1\endcsname\else
288     \edef\pgph@nm{\ifcsname pgph@num@#1\endcsname\csname pgph@num@#1\endcsname\fi}%
289     \ifx\pgph@nm\@empty

306 \space\space"#1" [label="\pgph@dn\space\pgph@nm"\pgph@es];}%
307 }

```

\pgph@edge Emit one edge, resolving the target label to an id and applying the self-loop, ignore and exclude filters. Targets beginning with `cite:` denote external nodes.

```

308 \newcommand\pgph@edge[2]{%
309 \IfBeginWith{#2}{cite:}%
310 {\pgph@citeedge{#1}{#2}}%
311 {\pgph@plainedge{#1}{#2}}%
312 }
313 \newcommand\pgph@plainedge[2]{%
314 \edef\pgph@t{\pgph@resolve{#2}}%
315 \ifx\pgph@t\empty\else
316 \ifcsname pgph@ex@#1\endcsname\else
317 \ifcsname pgph@ex@\pgph@t\endcsname\else
318 \ifcsname pgph@ig@#1@\pgph@t\endcsname\else
319 \ifboolexpr{ test {\ifnumequal{#1}{\pgph@t}}
320 and test {\ifdefstring{\pgph@selfloops}{remove}} }%
321 {\pgph@emitedge{#1}{\pgph@t}}%
322 \fi\fi\fi
323 \fi
324 }

```

\pgph@emitedge The relation recorded is always “the result whose proof we are in (the first argument) uses the target (the second)”. The `direction` option chooses the arrow orientation: `direction=usedby` (default) draws *target to result*, so an arrow `a->b` reads “a is used by b” (i.e. b relies on a); `direction=uses` draws *result to target* (“a uses b”). The filters above work on the recorded relation, so they are unaffected by the chosen orientation. **\pgph@writeedge** deduplicates.

```

325 \newcommand\pgph@emitedge[2]{%
326 \ifdefstring{\pgph@direction}{uses}%
327 {\pgph@writeedge{#1}{#2}}%
328 {\pgph@writeedge{#2}{#1}}%

333 \immediate\write\pgph@out{\space\space"#1" -> "#2";}%
334 \fi
335 }

```

\pgph@citeedge A `cite:key` target: declare the external node once (keyed, as a stable id, by the **\pgph@setcitelabel** BIB_T_EX key), then draw the edge. The node *label* is built by **\pgph@setcitelabel**: it is the key by default, or, with `citelabel=tag`, the printed citation tag (the “[42]”/“[Knu74]” text) recovered from the `\b@{key}` macro that **\bibcite** writes to the `.aux` (so two runs are needed, and it falls back to the key when no tag is known, e.g. on the first run or with citation packages that do not populate `\b@{key}`). A `\cite` note, when present, is prepended as “(note), ...”.

```

336 \newcommand\pgph@citeedge[2]{%
337 \ifcsname pgph@ex@#1\endcsname\else

```

```

408   \fi
409 }

```

The emission is registered at `\begin{document}` rather than at load time so that it is added to the end-document hook *after* packages loaded later (notably `apxproof`, whose appendix, with the deferred proofs and their references, is built at end of document). This way the graph is written only once that material has been typeset, and the emission does not disturb the verbatim replay of deferred proofs.

```

410 \AtBeginDocument{\AtEndDocument{\pgph@emit}}

```

`\proofgraph` Include the rendered graph (from a previous run) in `autorun` mode.

```

411 \newcommand\proofgraph[1][]{%
